

Test your implementation for the IT-Recht Kanzlei legal text interface

1 TestSuite

These tests are independent of the type of implementation and the programming language used for your interface, as the interface is tested via web requests. The tests themselves are executed via php. Use `runTestSuite.php` to execute the tests.

1.1 How it works

When `runTestSuite.php` is called, `src/UnitTestEndpoint.php` is started via the built-in web server of php. The tests from the `testCases` directory are then sent to the API URL via web request (`php_curl`) and the API is tested accordingly.

Please note: When running the tests, any existing legal texts will be overwritten!

1.2 Running the TestSuite

```
php runTestSuite.php --help
```

1.3 Testing your own implementation

```
php runTestSuite.php --api-url=http://www.example.com/itrk-test-api.php --api-token=IhrApiToken  
php runTestSuite.php --api-url=http://www.example.com/itrk-test-api.php --api-token=IhrApiToken  
--user-account-id=1 --test-name=action_invalid
```

Enter the corresponding URL for your API endpoint (`--api-url`).

Use your correct API token (`--api-token`) - the default here is "TEST-TOKEN".

For multishop systems, you can specify the target account (sales channel) with the `--user-account-id` parameter.

You can execute a single test with the parameter `--test-name`. You can use the file name from the "testCases" directory as the name (without `.json`)

1.4 Using curl

Alternatively, you can also use `curl` to test your interface:

```
curl -X POST {URL} -dxml='{XML}'

curl -X POST http://www.example.com/itrk-test-api.php -dxml='<?xml version="1.0" encoding="UTF-8" standalone="yes"?><api><api_version>1.0</api_version><rechtstext_pdf_filenamebase_suggestion>datenschutz</rechtstext_pdf_filenamebase_suggestion><rechtstext_pdf_localized_filenamebase_suggestion>Datenschutzerklaerung.pdf</rechtstext_pdf_localized_filenamebase_suggestion><rechtstext_pdf_filename_suggestion>datenschutz</rechtstext_pdf_filename_suggestion><user_auth_token>3910a691a9364947198394c4117bbe4d</user_auth_token><rechtstext_type>datenschutz</rechtstext_type><rechtstext_pdf>JVBERiAxMjM0</rechtstext_pdf><rechtstext_title>Datenschutzerklaerung</rechtstext_title><user_account_id>123</user_account_id><rechtstext_country>DE</rechtstext_country><rechtstext_language>de</rechtstext_language><rechtstext_language_iso639_2b>ger</rechtstext_language_iso639_2b><action>push</action><rechtstext_text>Beispielrechtstext</rechtstext_text><rechtstext_html>HTML Beispieltext</rechtstext_html></api>'
```

The XML and the expected response can be found in the json files in the testCases directory. To extract the XML, we have provided `src/XtractXml.php`. This extracts the XML from the testCase and inserts your API token and user_account_id (optional):

```
php src/XtractXml.php test-file api-token [user_account_id]
php src/XtractXml.php push_valid IhrApiToken MultiShopId
```

```
curl -X POST http://www.example.com/itrk-test-api.php -dxml="$ (php ./src/XtractXml.php push_valid IhrApiToken MultiShopId) "
```
